Gender-API helps you to find out whether a first name is more likely be used by males or females.
Use Our API

Gender-API.com API

Servers
- https://gender-api.com/v2 - Main (production) server

**default**

- POST /gender/by-first-name  Query by a single first name
- POST /gender/by-full-name  Query by a single full name
- POST /gender/by-email-address  Query by a single email address
- POST /gender/by-first-name-multiple  Query multiple names in a single request
- POST /gender/by-full-name-multiple  Query multiple names in a single request
Gender-API can be integrated in many apps and we are working hard to add even more.

- **Google Sheets**: Add our extension to Google sheets to genderize names directly in your spreadsheet.
- **Excel File Upload**: To enrich Microsoft Excel and CSV files, upload them directly to our platform. No installation needed.
- **Microsoft Excel Native Extension**: Select the column or cells that you need to genderize and click on the Gender-API button.
- **Numbers**: Select the column or cells that you want to genderize and then choose the Gender-API option.
Determine The Gender Based On An Email Address

Gender API
How It Works

You can split a full name with a single API call into a first name, a last name and a gender probability.
Upload Multiple Datasets In One Go

Easily bulk upload and process large dataset with up to 10,000,000 records per file using our CSV and Excel file upload feature.

<table>

</tbody>
</table>
Our API can be easily integrated into every existing platform in any language.
Add more accuracy to your request by localizing your queries.
How It Works

Specify your queries by adding:

- country code
- IP address
- location

When you query a name you can either provide a locale or we can determine the location of your customer based on his IP address or browser location.
What Countries We Support

We support 178 countries with 1,877,786 names in total.
# Subscriptions
